

The Financial Oracle

Ramen to Riches

Financial DNA Assessment

Complete Question Bank — All 20 Behavioural Questions

Total: 20 Questions · 4 Pillars · Maximum Score: 80 Points

Options scored 1 pt (least aligned) to 4 pts (most aligned)

USER PROFILE — Demographics Collection

Before the assessment begins, the app collects four profile data points. No data is stored or shared externally — these fields personalise the insights and score interpretations shown on the Results screen.

Field	Input Type / Options	Purpose in Assessment
Age	Numeric entry (16–80)	Contextualises advice by life stage
Profession Category	Corporate/Salaried Gig/Freelancer Student Business Owner	Personalises CapEx Vault and Feast-or-Famine insights
Monthly Income Bracket	Below ■25k ■25k–50k ■50k–1L ■1L–2L Above ■2L	Contextualises tax-optimisation and savings-rate benchmarks
Self-Rated Financial Knowledge	Slider 1–10 (1 = Beginner → 10 = Expert)	Calibrates explanation depth on the Results screen

SCORING KEY — How Points Work

Points	Behavioural Meaning	Pillar Tier (out of 20 pts)
4 pts	Most financially aligned — deliberate, systemised behaviour.	18–20 pts = Oracle tier
3 pts	Strong behaviour with room to sharpen into a full system.	14–17 pts = Strategist tier
2 pts	Partial discipline or reactive habit — intent without architecture.	10–13 pts = Apprentice tier
1 pt	Significant blind spot or counterproductive financial behaviour.	5–9 pts = Wanderer tier

Foundation

Cash flow architecture, CapEx Vaults, savings automation & lifestyle creep prevention

- | | |
|-------|---|
| 1 pt | I pay bills and spend freely — whatever is left at month-end gets saved. |
| 2 pts | I mentally decide a rough savings amount, then cover expenses with the rest. |
| 3 pts | I auto-transfer a fixed amount to a separate savings account before spending anything. |
| 4 pts | I auto-sweep 30% to needs, 30% to investments, 30% to lifestyle, 10% to an opportunity fund — all before I touch a rupee. |

- | | |
|-------|---|
| 1 pt | It feels like a raise, so my spending naturally expands to match the new number. |
| 2 pts | I allow myself a small treat but spend most of the extra without tracking it. |
| 3 pts | I keep lifestyle flat and route the entire ₹15,000 to savings or investments. |
| 4 pts | I follow a pre-agreed rule: 50% goes to investments and 50% gets spent intentionally on a pre-defined joy category. |

- | | |
|-------|---|
| 1 pt | It's a good month — I spend freely, assuming more projects will come. |
| 2 pts | I save a small fixed amount and use the rest to cover pending bills and desires. |
| 3 pts | I pay myself a fixed monthly 'salary' from a pool account and park the surplus there. |
| 4 pts | I maintain a CapEx Vault — a separate account for irregular large expenses (laptop, upskilling, taxes) funded during peak months so lean months don't break me. |

- | | |
|-------|---|
| 1 pt | I panic and put it on a credit card or borrow from family — no plan was in place. |
| 2 pts | I dip into my emergency fund, which stings but works. |
| 3 pts | I have a separate tech/gear fund I contribute to monthly — I use that without stress. |
| 4 pts | This is a non-event. My CapEx Vault covers planned asset replacements, my emergency fund stays untouched, and my income stream continues uninterrupted. |

1 pt	I remind myself mentally and try to invest when I remember — some months I do, some I don't.
2 pts	I set a calendar reminder at month-end to manually move money.
3 pts	I have SIP auto-debits on the 2nd of every month — right after salary day.
4 pts	My entire savings and investment architecture is automated on Day 1: SIPs, PPF contributions, RD installments, and vault transfers — all triggered without my intervention.

Growth Engine Rupee Cost Averaging (SIPs), PPF/EEE compounding & fixed income as portfolio ballast

- | | |
|-------|---|
| 1 pt | I pause my SIPs immediately to avoid 'throwing good money after bad'. |
| 2 pts | I feel nervous and consider pausing, but I ultimately do nothing. |
| 3 pts | I continue my SIPs undisturbed — I understand that volatility is the price of returns. |
| 4 pts | I continue my SIPs AND deploy a pre-planned lump sum from my opportunity fund — I treat the dip as a discount sale. |

- | | |
|-------|---|
| 1 pt | That makes sense — I try to time my investments to market dips. |
| 2 pts | I agree with the theory but I don't have the lump sum, so I just do SIPs. |
| 3 pts | I explain that lump-sum timing requires perfect information. SIPs leverage Rupee Cost Averaging to smooth cost basis over time, reducing regret risk. |
| 4 pts | I use a barbell strategy: a monthly SIP for disciplined averaging AND a pre-defined trigger to deploy lump sums only after a 10%+ index correction. |

- | | |
|-------|--|
| 1 pt | I don't use it — the 15-year lock-in puts me off. |
| 2 pts | I contribute the minimum to keep the account active. |
| 3 pts | I max out my ₹1.5L annual PPF contribution every year, ideally on April 1st for maximum compounding. |
| 4 pts | I max out my own PPF, have opened a PPF account for my spouse/minor child, and treat it as the risk-free backbone of my 30-year wealth ladder. |

- | | |
|-------|---|
| 1 pt | None — fixed income returns are lower than equity, so I avoid it entirely. |
| 2 pts | I have some FDs that my parents suggested — I haven't really thought about the strategy. |
| 3 pts | I allocate roughly 20–30% to debt instruments to reduce portfolio volatility and sleep better at night. |
| 4 pts | My fixed income allocation is my strategic ammunition — I hold debt so I have liquid capital to redeploy into equity when markets correct 15%+. |

1 pt	I put it in my savings account and move it somewhere when I figure out the plan.
2 pts	I put it all in an FD — safe and predictable.
3 pts	I split it: partial lump sum into an equity fund, partial into a short-duration debt fund for rebalancing fuel.
4 pts	I map it to my 'growth ladder': max out PPF first (EEE), then allocate the remainder across equity SIP top-up and a liquid fund for the next correction opportunity.

Strategy Competence Trap awareness: maximising corporate benefits & social capital as asset

1 pt	There are too many options and I'm afraid to pick the wrong one — I'll start when I know more.
2 pts	I'm waiting for market conditions to be 'right' before I invest.
3 pts	I accept imperfect action over perfect inaction — I start with a simple index fund SIP and refine later.
4 pts	I follow a pre-committed decision rule: if research exceeds 2 weeks, I default to a low-cost index fund and deploy capital immediately — optimisation is an ongoing process, not a prerequisite.

1 pt	Sounds smart — a custom model will definitely outperform generic funds.
2 pts	It's a great learning exercise, but maybe start investing something small meanwhile.
3 pts	That's the Competence Trap — their expertise is being weaponized against their wealth. Starting with index funds today costs nothing and risks nothing.
4 pts	I'd frame it as a decision cost analysis: every month of inaction is ~1% of annual equity returns lost forever due to compounding. The model needs to outperform by that opportunity cost just to break even.

1 pt	I skip it — the money is locked up and I need liquidity.
2 pts	I'm not sure if my employer offers this — I haven't checked.
3 pts	I contribute exactly up to the employer match limit — no more, no less. Free money first.
4 pts	I max the employer match AND use VPF strategically as tax-free debt-equivalent return, integrating it into my overall fixed income allocation.

1 pt	I just choose the default option HR gives me — it's not a big deal.
2 pts	I optimise a couple of obvious items like HRA and LTA but don't dig deeper.
3 pts	I spend 2–3 hours each April reviewing my entire salary structure to minimise my taxable CTC within legal limits.
4 pts	I model my entire post-tax take-home across both tax regimes, maximise every exempt component (NPS, LTA, meal, uniform allowance), and review again after any salary hike or life event.

1 pt	I'm too busy — I politely decline unless there's something immediate in it for me.
2 pts	I help if I have the time, but I don't keep track of these relationships systematically.
3 pts	I help generously and view my network as a long-term asset — referrals, co-investments, and opportunities flow through relationships built over years.
4 pts	I treat social capital as a portfolio: I invest time in high-trust nodes, give value first consistently, and periodically audit whether my network expands or contracts my financial opportunity set.

Psychology Psychological Capital, Feast-or-Famine protocol & dynamic liquidity buffers

- | | |
|-------|---|
| 1 pt | Guilty — I should have invested that money instead. |
| 2 pts | Slightly guilty, but I rationalise it as a one-time thing. |
| 3 pts | Zero guilt — this came from my designated 'joy budget' which I fund every month alongside my investments. |
| 4 pts | Pure joy — I track my Psychological Capital allocation the same way I track my SIPs. Experiences that prevent burnout are an investment in my earning capacity. |

- | | |
|-------|--|
| 1 pt | Respect — that's the kind of discipline needed to build real wealth. |
| 2 pts | I feel like maybe I'm not being disciplined enough with my own spending. |
| 3 pts | I'm concerned — extreme deprivation tends to cause binge spending or burnout that undermines the entire savings effort. |
| 4 pts | I'd help them model a 'Psychological Capital Budget' — if burnout causes even one job loss, it can erase 2–3 years of savings. Protecting mental reserves IS a financial strategy. |

- | | |
|-------|---|
| 1 pt | I pay down any pending dues and enjoy the rest — high-income months deserve high-spending months. |
| 2 pts | I invest a chunk and spend the rest more freely, knowing lean months will come eventually. |
| 3 pts | I pay myself my standard monthly 'salary' and route the surplus into a designated Income Smoothing Reserve. |
| 4 pts | I follow a pre-defined surplus split: 1/3 to Income Smoothing Reserve, 1/3 to investments, 1/3 to a Tax Vault (advance tax provision). The protocol runs automatically — I am not tempted to deviate. |

- | | |
|-------|---|
| 1 pt | I don't have a formal emergency fund — my savings account balance doubles as a buffer. |
| 2 pts | I follow the standard '3–6 months of expenses' rule I've seen online. |
| 3 pts | I recalibrate my liquidity buffer every 6 months based on my current income stability, dependents, and upcoming large expenses. |
| 4 pts | My liquidity buffer is dynamic and tiered: Tier 1 (instant access: 2 months in liquid fund), Tier 2 (FD: 3 months), Tier 3 (accessible investments: 2 months). Size adjusts based on income stability score I review quarterly. |

1 pt	I feel significant anxiety and start considering exiting my positions to 'stop the bleeding'.
2 pts	I feel uncomfortable but I've learned to do nothing — I just avoid checking the portfolio.
3 pts	I reframe the loss as 'units I'm buying cheaper' and check if my investment thesis has changed — if not, I stay the course.
4 pts	I follow a pre-committed drawdown protocol: at -15% I review my thesis; at -20% I deploy 10% of my Fixed Income ballast; at -30% I deploy another 10%. My responses are pre-programmed, so fear has no input.
